

Athens Alley- Phase 1

Phase I of the project consists of the installation of a 72” Corrugated Metal Pipe Detention Tank (Texas Ave), eight feet deep, and additional storm sewer conveyance facilities. This phase of the project will include the addition of storm sewers along Kelton Avenue to collect and convey runoff to the larger downstream storm sewer system. The runoff that currently flows through Athens Alley, via either overland flow or through the existing storm sewer, will be re-routed through the proposed detention tank and the proposed 36” corrugated plastic pipe to the existing downstream system.
